RAIN BIRD LAUNCHES NEW DB SERIES WIRE CONNECTOR

Installing irrigation control systems, valve boxes and soil moisture sensors requires making numerous wire splices, a process that can be very time-consuming. Improperly installed wire connections are difficult to locate and repair.

Now, there's an innovative product that reduces irrigation system installation time and the potential for wire connector-related service callbacks--the new Rain Bird® DB Series Wire Connector.

Because reliable wire connections are critical for the proper functioning of many irrigation system components, the DB Series is designed for a variety of applications. While appropriate for installing and repairing wire connections associated with valve boxes, soil moisture sensors and standard controller systems, the DB Series is also ideally suited for two-wire decoder systems.

Unlike other wire connectors on the market, Rain Bird's DB Series Wire Connector features a unique one-piece design that saves contractors a great deal of time formerly spent assembling wire connector parts. The DB series also includes a simple snap-tight Strain Relief that keeps wires from pulling apart, while waterproof silicone gel protects wires against corrosion. Manufactured of durable UV-material, the DB Series' Wire Connector will not degrade even after prolonged exposure to the sun's rays.
